Heating Power Plant in Linden - Hannover, Germany

The city of Hannover is known for its sustainability and environmental stewardship. The iconic Heating Power Plant in Linden Hannover is just one of the city's many initiatives on comprehensive energy management. To honor the 50th anniversary for the energy service company, Enercity launched a permanent illumination scheme to its Heating Power Plant towers due to the success of the well-received temporary installation in January 2013. Completed in just a short period of time, the lighting scheme is made possible by Traxon lighting solution and e:cue control system. With uninterrupted delivery of a rich, even wash, Traxon Shield AC Extend contributes to the mesmerizing façade illumination, adding truly enchanting visibility to the landmark towers. At dusk the three striking towers are immersed in saturated radiance shifting from red to violet – the signature Enercity brand colour that symbolizes 'positive energy'. The scheduling function of e:cue Lighting Control Engine (LCE) enables flexible yet precise control of illumination time. The entire lighting installation is set to automatically turn off after midnight as part of the company's effort to leverage technology innovation for wise and responsible energy use. Additionally, a Butler XT with temperature-sensitive control was installed to change the color gradient from cold blue to warm red when extreme temperature fluctuation occurs. Now a vibrant beacon for the industrial district, the illuminated Heating Power Plant delights the urban landscape of Hannover.
